IEEE DataPort™

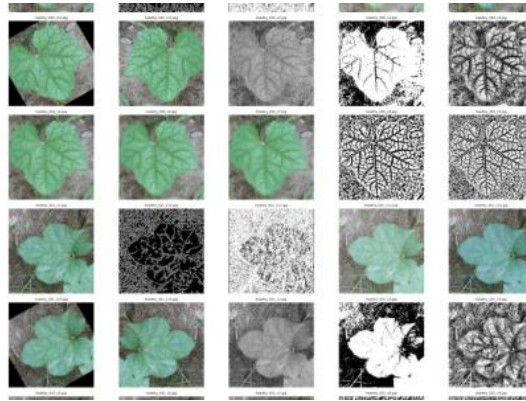

Unlock the Full Potential of Your Research with an IEEE DataPort Individual Subscription

Whether you're a researcher, data scientist, engineer, or scholarly author, an IEEE DataPort [Individual Subscription](#) empowers you to take your work to the next level. With access to thousands of high-quality datasets across all research disciplines, subscribers can access, store and manage valuable research data.

At just \$40/month, an [Individual Subscription](#) offers incredible value.

Recent & Popular Datasets

To access ALL datasets on the IEEE DataPort platform, [become an individual subscriber](#) today!

Healthy and Diseased Leaf Detection

This dataset comprises 9,000 preprocessed images of ridge gourd (Luffa) plant leaves, categorized into three groups: Healthy, Leaf Miner Infestation, and Mosaic Virus. The images were collected and augmented for use in plant disease detection tasks. Each of the 600 original leaf images (300 healthy + 300

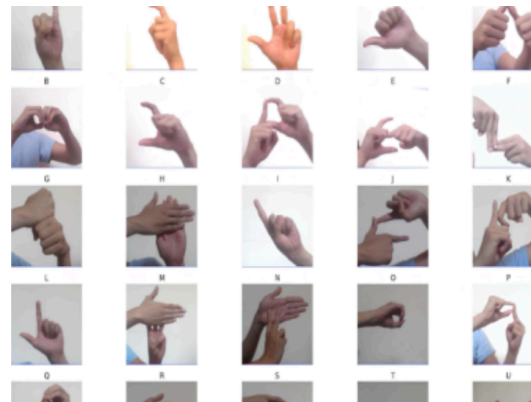

Smartphone Camera Image Identification

This curated image dataset supports research in source camera identification using images from mobile devices. The dataset contains 6315 RGB images acquired from six different smartphones under diverse real-world conditions. The images were captured in uncontrolled environments including indoor

distinct preprocessing techniques, resulting in a balanced dataset with 4,500 images per class.

Sign Language Image Dataset

This dataset consists of high-resolution images of static hand gestures representing Indian Sign Language (ISL) fingerspelling for alphabets (A–Z) and numbers (1–9). It includes approximately 400 images per class, covering a total of 35 classes, resulting in over 14,000 labeled images. The

perspectives and variable lighting. The images were taken casually, with no framing to add real-world complexity.

Spacecraft Segmenting and Pose Estimation

This supports research on event-based vision for space applications. It provides high-fidelity event streams simulated with the ICNS event camera emulator, synchronized RGB images, and dense, manually annotated semantic segmentation masks. The dataset includes 2000

inter-subject variability and enhance model generalization. All images were captured against two distinct backgrounds under varied lighting conditions to simulate real-world scenarios.

free and noisy variants for robust benchmarking. This dataset enables a wide range of studies in sparse event-based perception, monocular pose estimation, and space robotics.
